Polymers Building, data collected from aquifer and laboratory testing during previous hydrogeologic investigations (i.e., NAI, 1984; SME, 1991; and SME, 1995) at the General Alum facility were reviewed. During these three investigations, hydraulic conductivity data were collected from 13 on-site monitoring wells using a variety of in situ testing methods (i.e., constant-head, falling-head, and rising-head tests). Twelve of the monitoring wells tested were screened predominantly in till, and one (M-3D) in bedrock. In addition, the hydraulic conductivity of till samples retrieved from split-spoon sampling was determined in laboratory testing (ASTM Method D 5084) during the 1991 landfill hydrogeologic evaluation (SME, 1991). Results of hydraulic conductivity testing are summarized in Table 3-2.

In situ hydraulic conductivities of glacial till ranged from 2.2×10^{-8} to 1.8×10^{-4} centimeters per second (cm/sec), with a corresponding geometric mean of 1.5×10^{-6} cm/sec. Laboratory determinations of the hydraulic conductivity of remolded till samples averaged 3.1×10^{-8} cm/sec. The in situ hydraulic conductivity of bedrock determined in the one monitoring well analyzed was 6.1×10^{-5} cm/sec, at least an order of magnitude greater than the average in situ value calculated in till. No hydraulic conductivity tests are available on the glaciomarine clay from the site, but values typically range from 1×10^{-6} to 1×10^{-8} for soils of this type in Maine.

4.0 SOIL AND WATER ASSESSMENT

Since the initial Phase 1 field investigation in 1992, 174 soil and 28 groundwater samples have been collected from the vicinity of the Polymers Building and the Old Ammonia Plant for laboratory chemical analysis for VOCs. The subsections that follow present the analytical data compiled from the Phase 1, Phase 2, and Phase 3 field investigations.

4.1 Soil

Soil samples were obtained from split-spoon sampling of shallow borings during the field investigations. During each phase, a selected number of samples (84 total) were submitted to an off-site laboratory for chemical analysis of VOCs following field jar headspace screening with a PID meter. PID headspace screening data are included on each respective boring log in Appendix B. Chemical data from confirmatory laboratory analysis are contained in Appendix D. In addition, 90 samples were collected during the Phase 2 Field Investigation and were shipped to SME's field laboratory for GC analysis of nine target VOCs. Data tables containing the results of the GC analysis are in Appendix C. A summary of the laboratory and field GC analysis of soil samples is presented in Table 4-1A and 4-1B.

QUALIFIER DEFINITIONS:

D = COMPOUND DETERMINED IN ANALYSIS AT SECONDARY DILUTION FACTOR.
U = MATERIAL WAS ANALYZED FOR, BUT NOT DETECTED ABOVE LEVEL OF ASSOCIATED VALUE.
J = ASSOCIATED VALUE IS AN ESTIMATED QUANTITY.
T = COMPOUND REPORTED AS TRACE.
= BLANK FIELD INDICATES COMPOUND WAS NOT TESTED FOR.

QUALIFIER DEFINITIONS:

- D = COMPOUND DETERMINED IN ANALYSIS AT SECONDARY DILUTION FACTOR.
- U = MATERIAL WAS ANALYZED FOR, BUT NOT DETECTED ABOVE LEVEL OF ASSOCIATED VALUE.
- J = ASSOCIATED VALUE IS AN ESTIMATED QUANTITY.
- T = COMPOUND REPORTED AS TRACE.
- = BLANK FIELD INDICATES COMPOUND WAS NOT TESTED FOR.
